A high-performance shared storage solution.

NewTek Remote Storage (NRS) is the only fully integrated, supported, and co-developed shared storage solution for NewTek based media production environments, based on the EVO shared storage system from Studio Network Solutions (SNS).

By using VMC1, TriCaster and 3Play systems with NRS, teams can achieve faster turn-around by capturing media directly to RAID protected shared storage, enabling editors, producers, and other users in the workgroup to have instant, shared access to the same content from a secure central location. NRS includes easy-to-use management, cloud integration, and storage scalability.

- **Comprehensive Workflow Possibilities**
  With NRS RAID protected shared storage, entire workgroups have instant, shared access to the same content, providing much more efficient production workflows. Capture up to 8 NDI camera ISOs directly to NRS, while playing back graphics and DDR content such as stills, clips, and audio without limiting other network sources.

- **An Entire Suite of Included Workflow Tools**
  Search, tag, comment, preview, and organize files using ShareBrowser, built-in media asset management software for TriCaster®, VMC1, workstations, and web browsers. Quickly find and preview media across NRS storage and other local, offline, and network disks. Search based on tags, comments, custom fields, and harvested metadata. Use automation to move files across the network, or backup media to Amazon S3 and other on-premise storage. Run on-demand or scheduled data sync and replication across multiple NRS systems in one location, or around the world. Direct integration with Adobe Premiere, After Effects, Avid, Final Cut Pro X, and DaVinci Resolve to improve post-production workflows

- **Advanced Storage Capabilities**
  4-bay, 8-bay, and 16-bay options supporting capacities ranging from 24TB to multiple petabytes. Rackmount and desktop form factors, with optional storage and networking expansion. Recording of NDI® sources directly to secure shared storage. Support for simultaneous multi-channel capture, ingest, editing, and playback. Instant availability of recorded media for post-production turn around. High bandwidth multi-user media and project sharing. Enhanced features like secure project file locking, cloud backup, sync and replication, proxy previews, file automation, and asset tagging.
